

## PowerCom How it works:

PowerCom establish data communication connection between PowerPoint and wireless keypads via base station.

1. Design a four steps Polling Wizard for a Question slide to define how the answer from each keypad will be organized and presented a result graph for answer summary at end of the voting. You can optionally choose to skip the result display. Please see Poller for detail.
2. Configure base station Com Port, channel number, and voting parameters setting, set keypad range and test keypad.
3. Conduct voting with physical keypad used or in demo mode without keypad used. Display result summary for each question slide at end of voting. Conduct OLAP data analysis by Demographic question result.
4. Generate PowerCom reports after slide presentation is completed. Perform voting result data export and re-display of voting result graph presentation.
